

Epidermolysis Bullosa Awareness Week

October 25-31

What is EB?

- A group of rare disorders that cause the skin and mucuous membranes to be extremely fragile. Even minor friction, heat, or trauma can cause painful blisters and open wounds.
- Wounds caused by EB may be widespread, heal slowly, and are prone to life-threatening infections. 75% of one's body may be covered in bandages due to EB.
- Some common complications may include infection, anemia, growth retardation, inability to swallow, corneal abrasians, cancer, contractures, depression, anxiety, malnutrition, and premature tooth decay.
- EB can occur in every racial and ethnic group and affects both sexes. Approximately 200 children are born with EB every year in the Unites states. That equates to 1 in 20,000 births.
- There is no cure for EB, but there are treatments that help alleviate some of the most debilitating symptoms of certain types of EB.
